

matilda cloud

COMPANY PROFILE

Matilda Cloud is a comprehensive cloud migration and modernization platform that supports the full lifecycle of the customer's cloud journey. Matilda Cloud offers powerful automated tools for discovery and profiling of applications, automated migration and modernization, and performance and cost optimization.

OVERVIEW

Matilda Cloud's platform first automates the discovery of applications, infrastructure, services, web services, auxiliary services, databases, and other middleware components, and then performs automated assessments, migration and modernization of applications to the cloud using its sophisticated recommendation engine. With Matilda Cloud, businesses can modernize their application landscape at scale accurately and efficiently without much domain expertise and at greatly reduce costs. Matilda Cloud's platform increases customers' overall agility and scalability for future innovation and ongoing modernization in all major clouds.

Matilda Discover & Rapid Discovery

One of the key features of Matilda Cloud's platform is its ability to discover and profile applications, services, and infrastructure both on-premises and in the cloud. This provides businesses with a complete picture of their entire IT landscape and identifies the best application components for migration. Our platform provides a 360-degree view of the customer environment, including application infrastructure, service dependencies, EOSL viewpoint, departures from the well architected frameworks of major clouds, and cost and ROI calculations at enterprise and application levels.

Matilda Migrate

In addition to profiling and assessment, Matilda Cloud supports application migration and modernization in the cloud. Matilda Migrate uses the output of the Discover module to accelerate migration automatically and seamlessly. This includes rearchitecting, re-platforming, re-hosting, and re-factoring of applications to take full advantage of the benefits of the cloud. Matilda Cloud also supports the modernization of applications to cloud-native architectures, including containers and microservices. Our platform allows customers to generate infrastructure as code and blueprints for hundreds of cloud services automatically. With Matilda's automated approach to migration, companies avoid unwanted errors and unnecessary risk in their journey to the cloud.

Matilda Optimize

Matilda Optimize is a powerful solution designed to help customers improve performance and reduce costs in their cloud environment. It supports resource optimization and promotes savings by utilizing reserved instances, license optimization, optimization of PaaS services, and identification and elimination of underutilized resources. Matilda Optimize also provides detailed recommendations for modernizing legacy applications. The platform is built on its deep application profiling capability, allowing for optimal resource sizing for applications running on Kubernetes and VMs. Matilda Optimize ensures optimal performance and cost savings while maintaining service level agreements for applications, ultimately delivering efficient and effective cloud operations. Additionally, the solution incorporates the well-architected frameworks of AWS, OCI, Azure and GCP, promoting cost savings, security, and best practices.

Matilda Cloud provides innovative products that that automate the migration of applications to the cloud and optimize the operation of applications in the cloud.
